EXP_2026Q2_INVALID_SPLIT · SRM CHECK · OPERATOR

GROWTH · PRICING · 2026-06-05 · X^2 P = 0.0000

Sample ratio fails.

The observed split is too far from the expected split to trust the rest of the analysis. The verdict tree will fire INVALID-SRM at step 1; no metric value will be read.

WHAT THIS GATE DOES

Halt. The analyzer does not proceed to metrics.

A sample-ratio mismatch invalidates everything downstream — observed lift could just be a different population in each arm. The gate fires before any metric is read (R2).

OBSERVED SPLIT

4229 / 5771

expected 5000 / 5000

X^2 STATISTIC	P-VALUE
237.78	0.0000
THRESHOLD	VERDICT
0.0005	BLOCK

READING THIS CHECK

A small p-value here invalidates the rest of the analysis.

When the χ^2 p-value is below the pre-registered threshold, the most likely explanation is an assignment-service bug, not a real treatment effect. The tree refuses to proceed to step 2 — the user must investigate the assignment service or override with a documented NoShipReasonCode.
