Ship.

Primary CI clears zero on the benefit side. Guardrails clean. Late-window stable.

TL;DR

SHIP. **Roll the change to 100% of users.**

Lift of +1.70pp on conversion_rate cleared the 2.0% MDE bar and all guardrails came back clean. Late-window effect held steady.

LIFT ON CONVERSION_RATE

+1.70pp

treatment vs control · +17.2% relative

DECISION STEP
step 7

PRIMARY METRIC · CONVERSION_RATE

Treatment 11.59% vs Control 9.89%

Treatment and control rates on the same axis. The dark blue segment on the treatment bar is the absolute lift; the dotted line shows the lift relative to the control end.

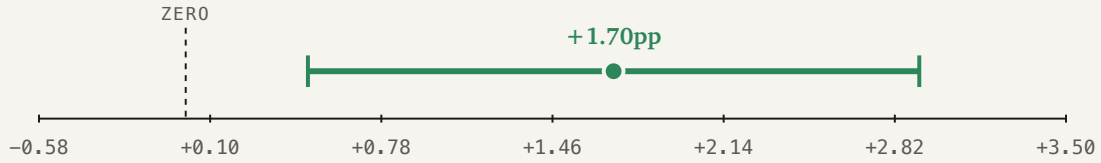

Per-arm conversion. The lift is +1.70pp absolute (+17.2% relative).

CONFIDENCE INTERVAL ON LIFT

95% CI on lift: (+0.49, +2.91)pp — clears zero on the benefit side.

The whole confidence interval lies above zero. We can rule out the null at $\alpha = 0.05$; the magnitude is what the verdict tree then weighs against the MDE.

The CI bar shows the range of plausible true lifts. The crossbars are the 95% bounds; the dot is the point estimate.

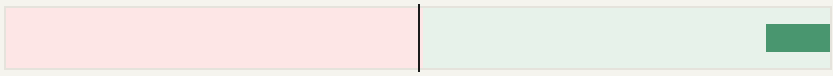

GUARDRAILS

Guardrail clear.

The pre-registered guardrails are revenue and (where wired) latency. None crossed their harm thresholds.
