Ship with caveat.

Real benefit-side lift, but smaller than half the pre-registered MDE.

TL;DR

SHIP WITH CAVEAT. **Ship — but the effect is smaller than the pre-registered MDE/2. Document and revisit.**

Lift of +1.83pp is real (CI excludes zero) but below half the pre-registered MDE. The effect is real but the business case may not clear the per-user cost.

LIFT ON CONVERSION_RATE

PRIMARY METRIC · CONVERSION_RATE

Treatment 11.97% vs Control 10.15%

Treatment and control rates on the same axis. The dark blue segment on the treatment bar is the absolute lift; the dotted line shows the lift relative to the control end.

Per-arm conversion. The lift is +1.83pp absolute (+18.0% relative).

CONFIDENCE INTERVAL ON LIFT

95% CI on lift: (+0.82, +2.83)pp — clears zero on the benefit side.

The whole confidence interval lies above zero. We can rule out the null at $\alpha = 0.05$; the magnitude is what the verdict tree then weighs against the MDE.

The CI bar shows the range of plausible true lifts. The crossbars are the 95% bounds; the dot is the point estimate.

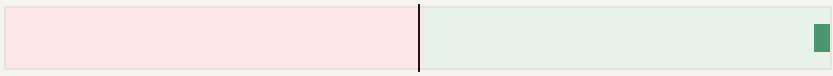

GUARDRAILS

Guardrail clear.

The pre-registered guardrails are revenue and (where wired) latency. None crossed their harm thresholds.
