Anchored price on PDP

Adding an anchored 'compare-at' price next to the sale price on the product detail page increases conversion by making the discount more salient at the moment of purchase intent.

AT A GLANCE

Primary metric is *conversion_rate*; decision is binary against Ship if conversion lift CI excludes zero on benefit side.

Pre-registered before any analysis. Decision is binary against conversion_rate: a 5.0% relative relative lift over a 10.0% baseline requires 3,200 per arm at the standard a / power settings. Guardrails sit on revenue_per_user.

SAMPLE REQUIRED (PER ARM)

3,200

to detect a 5.0% relative relative effect at a = 0.05, power = 0.80

MECHANISM

Why we think this works

Price anchoring is a well-studied behavioral effect: showing the original price increases perceived savings even when the actual discount is unchanged. This should lift conversion on items that are already on sale.

Sale items are ~30% of catalog impressions. Last 2025Q4 anchored-pricing test on the cart page showed flat conversion with a small AOV uplift.

METRICS

conversion_rate is the verdict-driving metric.

Primary is conversion_rate; secondaries inform interpretation but do not influence the verdict. Guardrails block ship if their 90% CI lies past the pre-registered harm boundary.

PRIMARY	**conversion_rate** Proportion · baseline 10.0% · MDE 5.0% relative · direction higher is better
SECONDARY	**add_to_cart_rate** Leading indicator. Not used for the ship/no-ship decision but informs interpretation.
SECONDARY	**average_order_value** Leading indicator. Not used for the ship/no-ship decision but informs interpretation.
GUARDRAIL	**revenue_per_user** Direction higher is better. Decision blocks if 90% CI lies past -5.0% relative.

POWER

Detecting smaller effects requires much more sample.

To resolve a 5.0% relative relative effect against a 10.0% baseline, we need 3,200 per arm. Tighter detection thresholds would climb the curve to the left — quickly.

Smaller effects require disproportionately more sample. Our design point is feasible inside the available user_id surface.

ASSIGNMENT + COHORTS

First-exposure attribution at the user_id level.

Each user is randomly assigned at first exposure to control or treatment in a 50 / 50 split. Events before first_exposure_at are not attributed to the experiment.

UNIT	**user_id** One row per (user_id, experiment_id) in the assignments table; first_exposure_at gates which events are attributed.

ARMS	**50 / 50** control · treatment
COHORT	**all assigned users**

DECISION RULES

Pre-registered. The analyze verb walks the same tree against the same metrics.

Ship if conversion lift CI excludes zero on benefit side.

SHIP	Primary 95% CI excludes zero on benefit side · no guardrail breach · novelty late-ratio ≥ 0.7
LIFT WITH CAVEAT	Real lift but below MDE/2 — surface the caveat in the readout but still consider rolling out
NO-SHIP · GUARDRAIL	Any guardrail's 90% CI lies past its harm threshold
NO-LIFT	Well-powered, primary CI straddles zero with half-width > 2 × MDE
INCONCLUSIVE	Underpowered (n < required) AND primary CI straddles zero
INVALID	SRM χ^2 $p < 0.0005$ and no override resolved — investigate assignment
