Sample ratio passes.

The observed split is close enough to the expected split that the rest of the analysis can proceed. This gate fires before any metric value is read.

WHAT THIS GATE DOES

Proceed to metrics. No assignment investigation required.

A sample-ratio mismatch invalidates everything downstream — observed lift could just be a different population in each arm. The gate fires before any metric is read (R2).

OBSERVED SPLIT

14924 / 15076

expected 15000 / 15000

X² STATISTIC	P-VALUE
0.77	0.3802
THRESHOLD	**VERDICT**
0.0005	PASS

READING THIS CHECK

A small p-value here invalidates the rest of the analysis.

χ^2 compares the observed split against the expected split. A p-value above the threshold means the split is consistent with random allocation. The analyzer is unblocked and reads the primary metric next.
