Intent for exp_fb984821

The statement below is the experiment's pre-registered intent. It was captured at the start of the design verb, before any metric value tied to assignment was read.

WHAT WE WANT TO TEST

Intent

Test whether moving the buy-now button above the fold on the product page improves conversion. Treatment renders the buy-now CTA above the fold; control renders the current below-fold placement. Population: product-page visitors on the demo storefront. Expected direction: treatment increases the primary conversion metric.

DISCIPLINE

What comes next

The intent is the first artifact in the design verb. The orchestrator will dispatch the understander to draft semantic models and metrics (only if missing), then the designer to draft a hypothesis, brief, and data plan, with the critic firing at every commit-worthy step. The brief seals only after a power-feasibility check passes and the user confirms.

The intent statement here carries no analysis output and no quantitative outcome claim. By R11 the design verb cannot reach an outcome-bearing column; this share-tail is the user's pre-registered statement of what the experiment is intended to learn, exactly as captured.
